Quiz instructions: Answer all questions.

**Q.1** [100 POINTS] [Students' average needed time to solve and review is 10 MINUTES]

Assume you are currently coding inside the body of the class **DFUtil**. Write the public static method **quizL02** that returns the names of all male adult passengers (above 18 years old) on flights to a destination that departed after a given date.

```
public static ArrayList<String> quizL02(String destination, LocalDate date){
    ArrayList<String>result = new ArrayList<String>();
    int age;
    for(Df df : DF.departures) {
        if(df!=null && df.getDestination().equals(destination) && date.isAfter(df.getDeptDate())) {
            for(Passenger p : df.getPassengers()) {
                if(p!=null && p.getGender()==Gender.Male) {
                    age=df.getDeptDate().getYear()-p.getDob().getYear();
                    if(age>=18) {
                        result.add(p.getName());
                    }
                }
            }
        }
    }
    return result;
}
```
